### Theoretical Probability & Experimental Probability ...

When you talk about the difference between theoretical and experimental probability, the theoretical probability is based on expectations. It is based on estimations and assumptions. On the other hand, the experimental probability is the actual set of results produced after the calculations have been completed.

## **Bing: Holt Theoretical And Experimental Probability**

Theoretical probability is a probability that is expected, for example when I flip a coin 100 times I expect tails to come up 50 times and heads to come up 50 times. The theoretical probability is 0.5 for a head. However, if I perform an experiment and flip a coin 100 times, tails might come up 44 times and heads 56 times.

In experimental probability, the success and the failure of the concerned event are measured/counted in a selected sample and then the probability is calculated. In theoretical probability, a mathematical model is used to determine the behaviour responses to an event within the considered sample or the population. Consider a bag containing 3 blue balls, 3 red balls, and 4 Yellow balls. If we calculate the probability of getting a red ball using probability theory, it is  $\frac{3}{10}$ .

## **LESSON Practice B 10-5 Experimental Probability**

The theoretical probability is 8.3% and the experimental probability is 4%. Although the experimental probability is slightly lower, this is not a significant difference. In most experiments, the theoretical probability and experimental probability will not be equal; however, they should be relatively close.

Holt McDougal Algebra 2 7-3 Independent and Dependent Events Example 1A: Finding the Probability of Independent Events A six-sided cube is labeled with the numbers 1, 2, 2, 3, 3, and 3. Four sides are colored red, one side is white, and one side is yellow. Find the probability. Tossing 2, then 2. Tossing a 2 once does not affect the probability of

## **Theoretical vs. Experimental Probability**

Theoretical probability is what we expect to happen, where experimental probability is what actually happens when we try

it out. The probability is still calculated the same way, using the number of possible ways an outcome can occur divided by the total number of outcomes. As more trials are conducted, the experimental probability generally gets closer to the theoretical probability.
