1) Load Flow Analysis - Load Flow Analysis or Power
Flow Analysis is the most crucial tactic to exploring
problems in power system operating and planning.
Based on a specified generating state and
transmission network structure, load flow analysis
solves the steady operation state with node voltages
and branch power flow in the power system.

A graduate certificate in power systems reinforces your career and allows you to take on responsibilities exclusively given to engineers with power-specific education. These specialized power systems graduate certificates will raise your knowledge and competency levels in key disciplines like protection and controls or power transmission.

The power sector landscape has been undergoing dramatic changes, shifting from one characterised by centralised, vertically integrated systems using a relatively small number of large dispatchable thermal power plants to one made up of markets with large numbers of power producers of all sizes, many of which are using variable renewable resources. At the same time, the role of digital technologies is increasing exponentially.

Power system analysis is the core of power engineering and its understanding is therefore essential for a career in this field. In this second course of the multi-part course series, you will learn about generators, electrical transformers, and transmission lines and their use in power system analysis. The course is divided into the following sections: 1. Generator Models: in section 2, we will introduce the synchronous generator, which is where all the power in power systems comes from.

Power system analysis - Course

This 15-hour course provides a thorough study of the power system data necessary, and the methods commonly used in analysis of power systems utilizing computer software. The following types of studies are covered: short circuit, load flow, motor starting, cable ampacity, stability, harmonic analysis, switching transient, reliability, ground mat, protective coordination, power system modeling.
